General Education Assessment Committee Report

Fall 2020

Executive Summary

Introduction

At the start of Fall 2020, faculty who were scheduled to teach First-Year Seminar (FYS) were contacted regarding submitting student work for general education assessment. This message included a copy of the Student Learning Outcome (SLO) description, rubric, and a random sample of student names. In addition, faculty were asked to send one assignment for each student, on which the students demonstrated the competencies indicated in the SLO.

At the beginning of the Fall 2020 semester, 1427 students were enrolled in 49 First-Year Seminar (FYS) sections (see Table One). These sections assessed SLO Five and Seven (Appendix A). Based on past GEAC efforts that have considered the feasibility of assessment and collected a statistically significant sample, we anticipated collecting 490 student work products that semester.

Rating Procedures

In Spring 2021, GEAC announced a call for faculty raters for Fall 2020 student work via email. Thirty-seven faculty volunteered and attended one of three training sessions facilitated by GEAC. Each rater then engaged in evaluating approximately ten student work products, with some faculty double-rating for reliability. Specifically, for SLO Five, 32 student work products were double rated (27%), and for SLO Seven, 58 work products were dual rated (27%).
Analysis of Category Ratings:
Preliminary results for both SLO’s are considered together. The data for SLO Five is overall lower in average ratings and negatively skewed, with 60% of ratings below two. The average first rating for SLO Five is 1.6, while the average first rating for SLO Seven is 2.1.

Students failed to demonstrate appropriate outcomes for SLO Five, with 60% of students not meeting the benchmark result expected. However, the result is not due to instruments not allowing students to demonstrate competence as student scores show that some achieved above the benchmark. There is not a significant difference between first-generation and non-first generations students; both groups fared poorly. For SLO Five, differences in performance based on racial background are limited, although White students had slightly more success.

First-Generation Students
There do not appear to be significant differences between the ratings of first-generation students and those with a parent who completed college, with first-generation students scoring very close to the overall average for both SLO Five and SLO Seven. Declared students’ work was rated higher than Undeclared students’ work for both SLO’s. The difference between groups was small, especially for SLO Five.

Racially Diverse Students
There are slight differences in average ratings by racial background. Disparate sample sizes must be considered when comparing these groups with one another. The average ratings across all racial categories were lower for SLO Five than they were for SLO Seven. White students’ average ratings were the highest for both SLO’s, but inter-group differences between groups were minor. The 1-point difference between multi-racial and White students for SLO Seven is worth consideration as the difference between those two specific groups was much smaller for SLO Five.

Pell Grant Recipients
On average, students who did not receive the PELL grant scored higher ratings than students who received the PELL grant. White students, on average, who did not receive the PELL grant scored the highest ratings. Students of unknown race who also did not receive the PELL grant scored the next highest ratings, followed by Hispanic and Black students.

Recommendations
The following recommendations are based on interpretations of the above analysis and historical context regarding SLO Five and Seven. Foremost, SLO Five was assessed by GEAC for the first time this term. Upon review of the submitted material, it was noted that many assessments did not align with the General Education rubric. This mismatch could be one reason for lower average proficiency relative to this SLO. Another explanation could be an insufficient emphasis on mastering higher-order thinking skills such as interpreting, evaluating, and applying data, as well as iterative opportunities to practice and receive feedback. Based on past practice whereby targeted professional development led to improvements in assignments and student proficiency, GEAC recommends that the Center for Effective Teaching (CET) provide professional development to FYS instructors about SLO Five and utilizing the rubric to design assessments. Sample assignments focused on information literacy should also be shared with faculty. In summary, GEAC recommends that the University continue to invest in FYS faculty professional
development resources relative to: 1) types and timing of assessments, 2) examining rubrics & sample assessments, and 3) engaging feedback on data collection processes.
**Student Learning Outcome (SLO) #5: Demonstrate the ability to retrieve, interpret, evaluate, and use information.**

**Definition:** Information literate students possess the set of integrated abilities encompassing the reflective discovery of information, the understanding of how information is produced and valued, and the use of information in creating new knowledge and participating ethically in communities of learning.

This SLO is met in General Education FYS: Discovering College and A: Communicating with and About the World.

Student Learning Outcome (SLO) #7: Demonstrate an understanding of various models for the development of the whole self.

**Definition:** Students identify best practices for self-development in areas such as finance, wellness, spiritual well-being, academic success, and professional motivation. Life skills and life-long learning are emphasized.

This SLO is met in General Education FYS – Discovering College and the First year Seminar Course.
